Family Perspectives on Bed Wetting in Young People

A comprehensive review of enuresis, such as this, has long been overdue. In this book attention is given to bladder control, reflecting current interest in developmental aspects of paediatrics, and to enuresis, reflecting the need to relieve a common cause of unhappiness. The topics discussed include how most children become dry by age four or five, and why a minority do not; why these children go on wetting their beds, and why some start doing so after a period of dryness. The prevalence of bedwetting in younger children varies curiously in different countries. Treatment, by explanation, by drugs and by the buzzer, is well covered in practical detail. Previously published articles are reviewed. In too many it has been difficult to determine whether authors are consistently writing about day-time or night-time, life-long or acquired, wetting. Emphasis is given to papers in which soundly based research is clearly reported. Though this book was inspired by and derives from a recent International Colloquium at Newcastle, it is anything but a report of that Colloquium. To extend coverage and avoid repetition, a number of chapters have been specially written, and papers have been re-written, fused or omitted; several up-to-date, comprehensive and authoritative reviews have been included. Whether readers are community, hospital or family doctors, or psychologists, they can enjoy criticizing and evaluating the at times differing views put forward, and can synthesise their own new and better conclusions. The editors have aimed to clear the way for further research by identifying clearly what is known and posing questions. Equally, however, it is hoped that this volume will promote a deeper and better understanding of bladder control and enuresis, and enable doctors who use it for reference to give more effective help to children with wetting problems.

Bedwetting In Children & Teens

Excerpt from Nocturnal Enuresis and Incontinence of Urine The list might be greatly extended. But such are a few of the causes which have been noticed as giving rise to it. It is evident, therefore, that it is futile to prescribe any routine course of treatment until a careful study of each case is made, and the point of origin of the disease determined. To the removal of that exciting cause the treatment should be at once directed. The enuresis being but a consequent or secondary pathological condition. Would be a matter for subsequent consideration. In glancing over the list of causes, it is apparent that, diverse as these may be, they can only act by giving rise to one of three prime conditions, viz: Atony or paralysis of the bladder itself, permitting over distension and resulting in stiliticidium.
